this title brings to the attention of researchers in the industry and in academia the application of  
fractals to help in modeling the analyte receptor binding and dissociation kinetics on biosensor  
surfaces the work builds on that done in engineering biosensors kinetics and design applications  
published by academic press in 2002 in particular more examples are provided of where  
biosensors may be effectively used this sequel is extremely timely given the anticipation that the  
applications and reliance on biosensors will increase due to the advances in miniaturization  
wireless communications and the development of new materials especially biological and  
chemical other applications of biosensors on the increase can be found in the protection of  
civilian structures and infrastructures protection from possible biological and chemical threats  
health care energy food safety and the environment to name a few covers all areas of  
applications of biosensors no other book on biosensors describes the kinetics of binding  
provides numerous examples of where biosensors may be used

design automation methods and tools for microfluidics based biochips deals with all aspects of  
design automation for microfluidics based biochips experts have contributed chapters on many  
aspects of biochip design automation topics covered include device modeling adaptation of  
bioassays for on chip implementations numerical methods and simulation tools architectural  
synthesis scheduling and binding of assay operations physical design and module placement  
fault modeling and testing and reconfiguration methods
